WHAT ARE THE BENEFITS OF FILTERED WATER?

CHOOSING A PME WATER FILTRATION SYSTEM IS A PURE AND SIMPLE CHOICE

PME can supply and install a large range of filtration systems that will suit any house hold or commercial installation. We only sell the highest quality water filters and associated products that comply with Australian and New Zealand plumbing standards.

If you stopped to think what our water is exposed to before it comes out of your tap, you probably wouldn't drink it.

Water dissolves most substances it comes in contact with. As rain falls, it collects airborne industrial pollution, rubbish and other pollutants that then run off into the reservoirs and waterways. Our water is then piped to treatment plants where chemicals such as chlorine, ammonia and multiple other chemicals are added into our domestic water by the local authority to counter the many forms of bacteria and toxins that develop in the water. These chemicals don't always do their intended job and give our domestic water a slight odour, bad taste and can have unhealthy effects on the body. This chemically processed water is then delivered to your household taps.

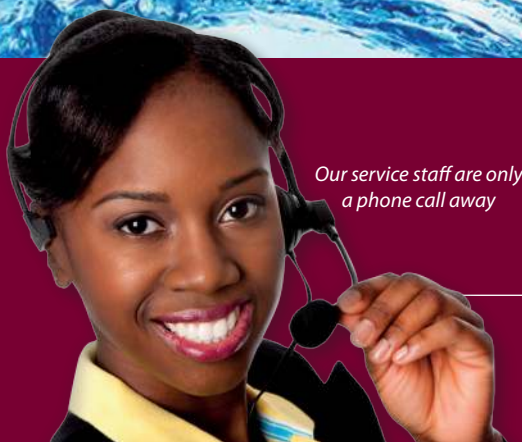

The reality is, there's very little we can do to solve the overall problem of pollutants in our household water. We can dramatically reduce these issues by filtering our water.

FILTERS ARE A COST EFFECTIVE AND CONVENIENT WAY OF GETTING CLEAN SAFE DRINKING WATER

REMOVES HARMFUL TOXINS AND BACTERIA WITHOUT REMOVING ALL THE BENEFICIAL MINERALS

WATER TREATMENT FACILITIES DO NOT ALWAYS CONTROL THE OUTBREAK OF DANGEROUS CONTAMINANTS

FILTERED WATER IS A GREAT WAY TO KEEP HYDRATED AND HEALTHY
